## Job Market Paper

### "Farm Labor Supply and Food Production," with Pierre Mérel. [Link](#)

This study provides econometric estimates of the effects of shifts in the farm labor supply on hand-harvested fruit and vegetable production. Using crop production and employment data from California counties, we estimate panel regressions linking farm employment to crop production outcomes. Because we exploit variation in equilibrium employment, as opposed to exogenous variation in the labor supply curve, we use an equilibrium displacement model to identify plausible sources of estimation bias; we argue that our regression estimates should be interpreted as upper bounds for the effects of interest. Our results indicate that a ten percent decrease in the farm labor supply (in terms of the number of workers) causes at most a 4.2% reduction in production in the top 10 producing counties. Production effects are channeled primarily through a reduction in harvested acreage, although we also uncover some effects on yield.
